Problem E

Scam

Time limit: 1 second
Memory limit: 256 MB

Mr. Ucup has just received a message from an unknown phone number claiming to be his child who is studying in another city. In the message, the sender asks Mr. Ucup to transfer some money because their allowance has run out, and says they are using a new phone number because the old one can no longer be used. Mr. Ucup knows his child's messages well, and he knows that a message from his child asking for money satisfies **all three** of the following properties:

1. The message contains no digits (`0` – `9`).
2. The message contains the character `#` at least once.
3. Every group of the **same** vowel (`A`, `I`, `U`, `E`, `O`) appearing **consecutively** in the message must have a size of **exactly 2**. Any other character, including `#`, breaks a group. Consonants may appear any number of times. A message with no vowels still satisfies this property.

A message follows the child's pattern if and only if it satisfies all three properties above. Determine whether the message follows the pattern!

Input

– The first line contains an integer N ($1 \leq N \leq 100$), the length of the message.

– The second line contains a string S of exactly N characters.

Each character of S is an uppercase letter (`A` – `Z`), a digit (`0` – `9`), or the character `#`.

Output

– If the message follows the child's pattern, print "`I will send it right now!`". Otherwise, print "`You are not my child!`".

Sample Input 1	Sample Output 1
14 AA#II#UU#EE#OO	I will send it right now!

Sample Input 2	Sample Output 2
15 #IINEEDMOONEEY1	You are not my child!

Sample Input 3	Sample Output 3
10 HEEELPMEE#	You are not my child!
